29_Compressed Mean Easy - Solution

Source - https://datalemur.com/questions/alibaba-compressed-mean

Running Notes

- find the mean number of items per order on Alibaba
- rounded to 1 decimal place
- · we need to calculate the arithmetic average
- so, this won't work

```
SELECT ROUND(AVG(order_occurrences),1) AS mean
FROM items_per_order;
```

- · because,
- This is how the airthmetic average is calculated

Let's calculate the arithmetic average:

```
Total items = (1*500) + (2*1000) + (3*800) + (4*1000) = 8900

Total orders = 500 + 1000 + 800 + 1000 = 3300

Mean = 8900 / 3300 = 2.7
```

SELECT ROUND(SUM(item_count*order_occurrences)/SUM(order_occurrences

So this gave an error

```
function round(double precision, integer) does not exist (LIN
E: 1)
```

Why this error?

The ROUND() function in PostgreSQL expects its first argument to be of type **numeric**, not double precision. While both numeric and double precision can represent decimal numbers, PostgreSQL treats them differently:

- 1. double precision: A floating-point type that is faster but can lose precision for very large or very small numbers.
- 2. numeric: A fixed-precision type designed for exact arithmetic.

The ROUND() function is specifically designed for the numeric type, not for double precision. Without an explicit cast, PostgreSQL cannot automatically convert a double precision result into numeric when passed to the ROUND() function, hence the error.

In PostgreSQL, dividing two integers results in a **DOUBLE PRECISION** value if there is a fractional part.

Even though the original columns are INTEGER, the division SUM(item_count * order_occurrences) / SUM(order_occurrences) likely returns a DOUBLE PRECISION due to PostgreSQL's handling of division in aggregate functions. The ROUND() function with two arguments (ROUND(value, precision)) only supports the NUMERIC type, not DOUBLE PRECISION.

So after fixing it

```
SELECT ROUND((SUM(item_count*order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrences)/SUM(order_occurrence
```
